Revision History

Version	Date	Author	Description
4.0	2023-Jan-30	CGI	Initial SWIFT MX CBPR+ 2.1 implementation (MX BSOL branch)
4.1	Aug 2025	MCC	APSSE-10604 - changes to MA availability for transactions that got NAK'd when sending to SWIFT. See section 4.3.2.4.

1 Introduction

1.1 Document Purpose

The Business Solution (BSOL) describes the behavior of APS with respect to processing MX related messages. It is the basis for understanding the behavior of APS, and acceptance and assessment of any changes requested during the implementation project.

This document's purpose is to provide the functional specification of the base product for CGI and client teams.

1.2 Document Range

The BSOL contains details of how MX transactions are processed using workflows. The workflow steps are built from “business modules”.

The BSOL contains:

- System Context – description of the logical integration of APS with other systems. Please also see [DIS] for details, which contains details of interfaces which trigger the workflow processing, or are triggered by it, or otherwise support the processing.
- Payment and Product Classification – overview of how APS internally categorizes various financial and non-financial transactions for MX processing.
- MX Transaction Processing – definition how MX transactions are processed.
- Business Modules – functional description of shared complex functional modules used in MX transaction processing.

1.3 Status of the Document

The status of the document is DRAFT.

1.4 Change Management

Change Management is managed by CGI. The document is updated by the CGI team during the implementation and updated versions of the document are provided with each release of APS – as the new functions are enabled.

Changes against the previous version of the document are marked using the “track changes” tool.

1.5 References

This references the following documents.

Title	ID	Version	Date	Description
APS Detailed Interface Specification	DIS	4.15	Aug 2025	Detailed Interface Specification states the interfaces used to communicate with APS

Title	ID	Version	Date	Description
CBPR+ User Handbook (www.swift.com)	SWIFT	SR2025		This is a comprehensive repository of all of the SWIFT standards for message formats and message usage

1.6 Glossary of Terms and Abbreviations

Terms	Meaning
Batch	A Batch is a group of transactions which are loaded to the system or sent from the system together. Batch records are stored in batch tables separately from records of transactions (which are stored in tables of transactions).
BEN (beneficiary) charge	The originator of a payment does not pay the charge; the charge is paid by the beneficiary
XCT	Foreign payments Transfers

2 System Context

The diagram below shows the logical data flows in to and out of APS. Some flows are implemented by several technical interfaces; e.g., an interface per format or transport type.

Exhibit 2-1 System Context

For each of these logical interfaces, the underlying technical interfaces, the message types and the message formats used are stated in the [DIS].

3 Payment and Product Classification

This chapter is an overview of payment processing and payment classification.

3.1 Base Transaction Flows

For the purposes of high-level transaction processing categorization, there are several “base” transaction flows.

3.2 Payment Scheme

Each Payment Scheme reflects a basic payment instrument or scheme as used in a particular country or locality.

3.3 Transaction Type Structure

This chapter is an overview of Transaction Types. Transaction Type and Payment Scheme are the basic instruments for application of business logic for transaction processing.

3.3.1 SWIFT Transaction Types

All transactions have a 6-digit transaction type. The values and meanings of each digit are described in the table below.

Exhibit 3-1 SWIFT Transaction Types

4 Transaction Processing

4.1 Processing Overview

APS processes payments using a set of workflows.

4.2 International and US Domestic Transactions Concept

The following chapter summarizes high level approach to the selection of payment processing flows for international payments

4.2.1.1.1 Normalizing Special Character for Counterparty Account

APS validates the counterparty account and removes special character, if ANY of those accounts contains any special characters.
